Radiation Hardened Low-Side GaN FET Driver

FN8984
Rev.4.00
Apr 6, 2018

The ISL70040SEH and ISL73040SEH are low-side drivers designed to drive enhancement mode Gallium Nitride (GaN) FETs in isolated topologies and boost type configurations. The ISL70040SEH operates with a supply voltage from 4.5V to 13.2V and has both inverting (INB) and non-inverting (IN) inputs to satisfy requirements for inverting and non-inverting gate drives with a single device.

The ISL70040SEH and ISL73040SEH have a 4.5V gate drive voltage (V_{DRV}) generated using an internal regulator which prevents the gate voltage from exceeding the maximum gate-source rating of enhancement mode GaN FETs. The gate drive voltage also features an undervoltage lockout (UVLO) protection that ignores the inputs (IN/INB) and keeps OUTL turned on to ensure the GaN FET is in an OFF state whenever V_{DRV} is below the UVLO threshold.

The ISL70040SEH and ISL73040SEH inputs can withstand voltages up to 14.7V regardless of the V_{DD} voltage. This allows the ISL70040SEH and ISL73040SEH inputs to be connected directly to most PWM controllers. The ISL70040SEH and ISL73040SEH split outputs offer the flexibility to adjust the turn-on and turn-off speed independently by adding additional impedance to the turn-on/off paths.

The ISL70040SEH and ISL73040SEH operate across the military temperature range from -55°C to +125°C and are offered in an 8 Ld hermetically sealed ceramic Surface Mount Device (SMD) package or die form.

- ISL70040SEH and ISL73040SEH product pages

Features

- **Wide operating voltage range of 4.5V to 13.2V**
- **Up to 14.7V logic inputs (regardless of V_{DD} level)**
  - **Inverting and non-inverting inputs**
- **Optimized to drive enhancement mode GaN FETs**
  - **Internal 4.5V regulated gate drive voltage**
  - **Independent outputs for adjustable turn-on/turn-off speeds**
- Full military temperature range operation
  - T_A = -55°C to +125°C
  - T_J = -55°C to +150°C
- Radiation hardness assurance (wafer-by-wafer)
  - High Dose Rate (HDR) (50-300rad(Si)/s): 100krad(Si) (ISL70040SEH only)
  - Low Dose Rate (LDR) (0.01rad(Si)/s): 75krad(Si)
- SEE hardness (refer to the ISL70040SEH, ISL73040SEH SEE Report for details)
  - No SEB/L LET_{TH}, V_{DD} = 14.7V: 86MeV•cm^2/mg
  - No SET, LET_{TH}, V_{DD} = 13.2V: 86MeV•cm^2/mg
  - Electrically screened to DLA SMD 5962-17233

Applications

- Flyback and forward converters
- Boost and PFC converters
- Secondary synchronous FET drivers

Notes:

1. Specifications for Rad Hard QML devices are controlled by the Defense Logistics Agency Land and Maritime (DLA). The SMD numbers listed must be used when ordering.
2. These Pb-free Hermetic packaged products employ 100% Au plate - e4 termination finish, which is RoHS compliant and compatible with both SnPb and Pb-free soldering operations.
3. The /PROTO and /SAMPLE are not rated or certified for Total Ionizing Dose (TID) or Single Event Effect (SEE) immunity. These parts are intended for engineering evaluation purposes only. The /PROTO parts meet the electrical limits and conditions across the temperature range specified in the DLA SMD and are in the same form and fit as the qualified device. The /SAMPLE die is capable of meeting the electrical limits and conditions specified in the DLA SMD at +25°C only. The /SAMPLE is a die and does not receive 100% screening across the temperature range to the DLA SMD electrical limits. These part types do not come with a certificate of conformance because there is no radiation assurance testing and they are not DLA qualified devices.
4. Evaluation board uses the /PROTO parts. The /PROTO parts are not rated or certified for Total Ionizing Dose (TID) or Single Event Effect (SEE) immunity.

Table 1. Key Differences Between Family of Parts

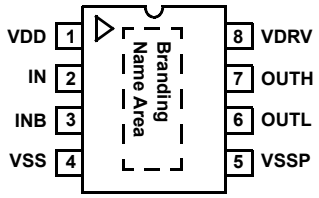
1.4 Pin Configuration

ISL70040SEH and ISL73040SEH
(8 Ld SMD)



NOTE: The ESD triangular mark indicates Pin #1. It is a part of the device marking and is placed on the lid in the quadrant where Pin #1 is located.

1.5 Pin Descriptions

Pin Number	Pin Name	ESD Circuit	Description
1	VDD	3	Supply for the internal linear regulator of the ISL70040SEH and ISL73040SEH. The supply to VDD should be locally bypassed using at least a 4.7µF ceramic capacitor.
2	IN	3	Non-inverting input pin which controls the OUTH and OUTL outputs. This input has TTL/CMOS type thresholds. When using this device in an inverting application, this pin should be tied to VDD to enable the outputs.
3	INB	3	Inverting input pin which controls the OUTH and OUTL outputs. This input has TTL/CMOS type thresholds. When using this device in a non-inverting application, this pin should be tied to VSS to enable the outputs.
4	VSS	4	Supply ground. Connect this pin to VSSP from the PCB ground plane.
5	VSSP	4	Power supply ground. Connect this pin to VSS from the PCB ground plane.
6	OUTL	2	Output low pin which is the gate driver turn-off output. Connect to the gate of the GaN FET with a short, low inductance path. A series gate resistor can be used to adjust the turn-off speed.
7	OUTH	1	Output high pin which is the gate driver turn-on output. Connect to the gate of the GaN FET with a short, low inductance path. A series gate resistor can be used to adjust the turn-on speed.
8	VDRV	1	Internal linear regulator output and the gate drive voltage. This pin should be locally bypassed using at least a 4.7µF ceramic capacitor; 2µF to 10µF with variability.
N/A	LID	N/A	Internally connected to VSSP (Pin 5).

4. Functional Description

4.1 Gate Drive for N-Channel GaN FETs

New technologies based on wide-band gap semiconductors produce high electron mobility transistors (HEMT). An example of a HEMT is the GaN based power transistors such as the ISL70023SEH and ISL70024SEH, which offer very low $r_{DS(ON)}$ and gate charge (Qg). These attributes make the devices capable of supporting very high switching frequency operation while not suffering significant efficiency loss. However, GaN power FETs have special requirements in terms of gate drive, which the ISL70040SEH and ISL73040SEH are designed to specifically address.

The key properties of a gate driver for GaN FETs are:

(1) Gate drive signals need to be sufficiently higher than the V_{GS} threshold specified in GaN FET datasheets for proper operation.

(2) A well regulated gate drive voltage to keep the V_{GS} lower than specified absolute maximum level of 6V.

(3) Split pull up and pull down gate connections to add series gate resistors to independently adjust turn-on and turn-off speed, without the need for a series diode with a voltage drop that may cause an insufficient gate drive voltage.

(4) Driver pull-down resistance <0.5Ω (typical) to eliminate undesired Miller turn-on.

(5) High current source/sink capability and low propagation delay to achieve high switching frequency operation.

4.2 Functional Overview

The ISL70040SEH and ISL73040SEH are single channel high speed enhanced mode GaN FET low side drivers for isolated power supplies and Synchronous Rectifier (SR) applications.

The ISL70040SEH and ISL73040SEH offer a wide operating supply range of 4.5V to 13.2V. The gate drive voltage is generated from an internal linear regulator to keep the gate-source voltage below the absolute maximum level of 6V for the ISL7002xSEH GaN FET devices.

The input stage can handle inputs to the 14.7V independent of V_{DD} and offers both inverting and non-inverting inputs. The split output stage is capable of sourcing and sinking high currents and allows for independent tuning of the turn-on and turn-off times. The typical propagation delay of 40ns enables high switching frequency operation.

5. Applications Information

5.1 Undervoltage Lockout

The VDD pin accepts a recommended supply voltage range of 4.5V to 13.2V and is the input to the internal linear regulator. VDRV is the output of the regulator and is equal to 4.5V. VDRV provides the bias for all internal circuitry and the gate drive voltage for the output stage.

An UVLO circuitry monitors the voltage on VDRV and is designed to prevent unexpected glitches when VDD is being turned on or turned off. When VDRV < ~1V, an internal 500Ω resistor connected between OUTL and ground helps keep the gate voltage close to ground. When ~1.2V < VDRV < UV, OUTL is driven low while ignoring the logic inputs and OUTH is in a high impedance state. This low state has the same current sinking capacity as during normal operation. This ensures that the driven FETs are held off even if there is a switching voltage on the drains that can inject charge into the gates from the Miller capacitance.

When VDRV > UVLO, the output will start to respond to the logic inputs following the next rising edge on IN or falling edge on INB. In the non-inverting operation (PWM signal applied to the IN pin) the output is in phase with the input. In the inverting operation (PWM signal applied to the INB pin) the output is out of phase with the input.

For the negative transition of VDD through the UV lockout voltage, the OUTL is active low and OUTH is high impedance when VDRV < ~3.7VDC regardless of the input logic states.

5.2 Input Stage

The input thresholds of the ISL70040SEH and ISL73040SEH are based on a TTL and CMOS compatible input threshold logic that is independent of the supply voltage. With typical high threshold = 1.7V and typical low threshold = 1.4V, the logic level thresholds can be conveniently driven with PWM control signals derived from 3.3V and 5V power controllers.

The ISL70040SEH and ISL73040SEH offer both inverting and non-inverting inputs. The state of the output pin is dependent on the bias on both input pins. Table 2 summarizes the inputs to output relation.

Table 2. Truth Table

IN	INB	OUT	OUTH	OUTL
0	0	0	Hi-Z	0
0	1	0	Hi-Z	0
1	0	1	1	Hi-Z
1	1	0	Hi-Z	0

Note: OUT is the combination of OUTH and OUTL connected together. Hi-Z represents a high impedance state.

As a protection mechanism, if any of the input pins are left in a floating condition, OUTL is held in the low state and OUTH is high impedance. This is achieved using a 300kΩ pull-up resistor on the INB pin to VDD and a 300kΩ pull-down resistor on the IN pin to VSS. For proper operation in non-inverting applications, INB should be connected to VSS. For proper operation in inverting applications, IN should be connected to VDD.

5.3 Enable Function

An enable or disable function can be easily implemented in the ISL70040SEH and ISL73040SEH using the unused input pin. The following guidelines describe how to implement an enable/disable function:

- In a non-inverting configuration, the INB pin can be used to implement the enable/disable function. OUT is enabled when INB is biased low, acting as an active low enable pin.
- In an inverting configuration, the IN pin can be used to implement the enable and disable function. OUT is enabled when IN is biased high, acting as an active high enable pin.

5.4 Power Dissipation of the Driver

The power dissipation of the ISL70040SEH and ISL73040SEH is dominated by the losses associated with the gate charge of the driven bridge FETs and the switching frequency. The internal bias current also contributes to the total dissipation but is usually not significant compared to the gate charge losses.

For example, the ISL70024SEH has a total gate charge of 5nC when V_{DS} = 100V and V_{GS} = 4.5V. This is the charge that a driver must source to turn on the GaN FET and must sink to turn off the GaN FET.

Use Equation 1 to calculate the power dissipation of the driver:

(EQ. 1) $$P_D = 2 \bullet Q_c \bullet freq \bullet V_{GS} \bullet \frac{r_{gate}}{r_{gate} + r_{DS(ON)}} + I_{DD}(freq) \bullet V_{DD}$$

where:

freq = switching frequency

$V_{GS} = V_{DRV}$ bias of the ISL70040SEH and ISL73040SEH

Q_c = gate charge for V_{GS}

I_{DD}(freq) = bias current at the switching frequency

$r_{DS(ON)}$ = ON-resistance of the driver

r_{gate} = external gate resistance (if any)

Note that the gate power dissipation is proportionally shared with the external gate resistor. Do not overlook the power dissipated by the external gate resistor.

5.5 General PCB Layout Guidelines

The AC performance of the ISL70040SEH and ISL73040SEH depends significantly on the design of the Printed Circuit Board (PCB). The following layout design guidelines are recommended to achieve optimum performance:

- Place the driver as close as possible to the driven power FET
- Understand where the switching power currents flow. The high amplitude di/dt currents of the driven power FET will induce significant voltage transients on the associated traces
- Keep power loops as short as possible by paralleling the source and return traces
- Use planes where practical; they are usually more effective than parallel traces
- Avoid paralleling high amplitude di/dt traces with low level signal lines. High di/dt will induce currents and consequently, noise voltages in the low level signal lines
- When practical, minimize impedances in low level signal circuits. The noise that is magnetically induced on a 10kΩ resistor is 10 times larger than the noise on a 1kΩ resistor
- Be aware of magnetic fields emanating from transformers and inductors. Gaps in the magnetic cores of these structures are especially bad for emitting flux
- If you must have traces close to magnetic devices, align the traces so that they are parallel to the flux lines to minimize coupling
- The use of low inductance components such as chip resistors and chip capacitors is highly recommended
- Use decoupling capacitors to reduce the influence of parasitic inductance in the V_{DRV}, V_{DD}, and GND leads. To be effective, these capacitors must also have the shortest possible conduction paths. If vias are used, connect several paralleled vias to reduce the inductance of the vias
- It may be necessary to add resistance to dampen resonating parasitic circuits, especially on OUTH. If an external gate resistor is unacceptable, then the layout must be improved to minimize lead inductance

- Keep high dv/dt nodes away from low level circuits. Guard banding can be used to shunt away dv/dt injected currents from sensitive circuits. This is especially true for control circuits that source the input signals to the ISL70040SEH and ISL73040SEH
- Avoid placing a signal ground plane under a high amplitude dv/dt circuit. This will inject di/dt currents into the signal ground paths
- Calculate power dissipation and voltage drop for the power traces. Many PCB/CAD programs have built-in tools for calculation of trace resistance
- Large power components (such as power FETs, electrolytic caps, and power resistors) will have internal parasitic inductance which cannot be eliminated. Account for this in the PCB layout and circuit design
- If the circuits are simulated, consider including parasitic components, especially parasitic inductance
- The GaN FETs have a separate substrate connection which is internally tied to the source pin. Source and substrate should be at the same potential. Limit the inductance in the OUTH/L to Gate trace by keeping it as short and thick as possible

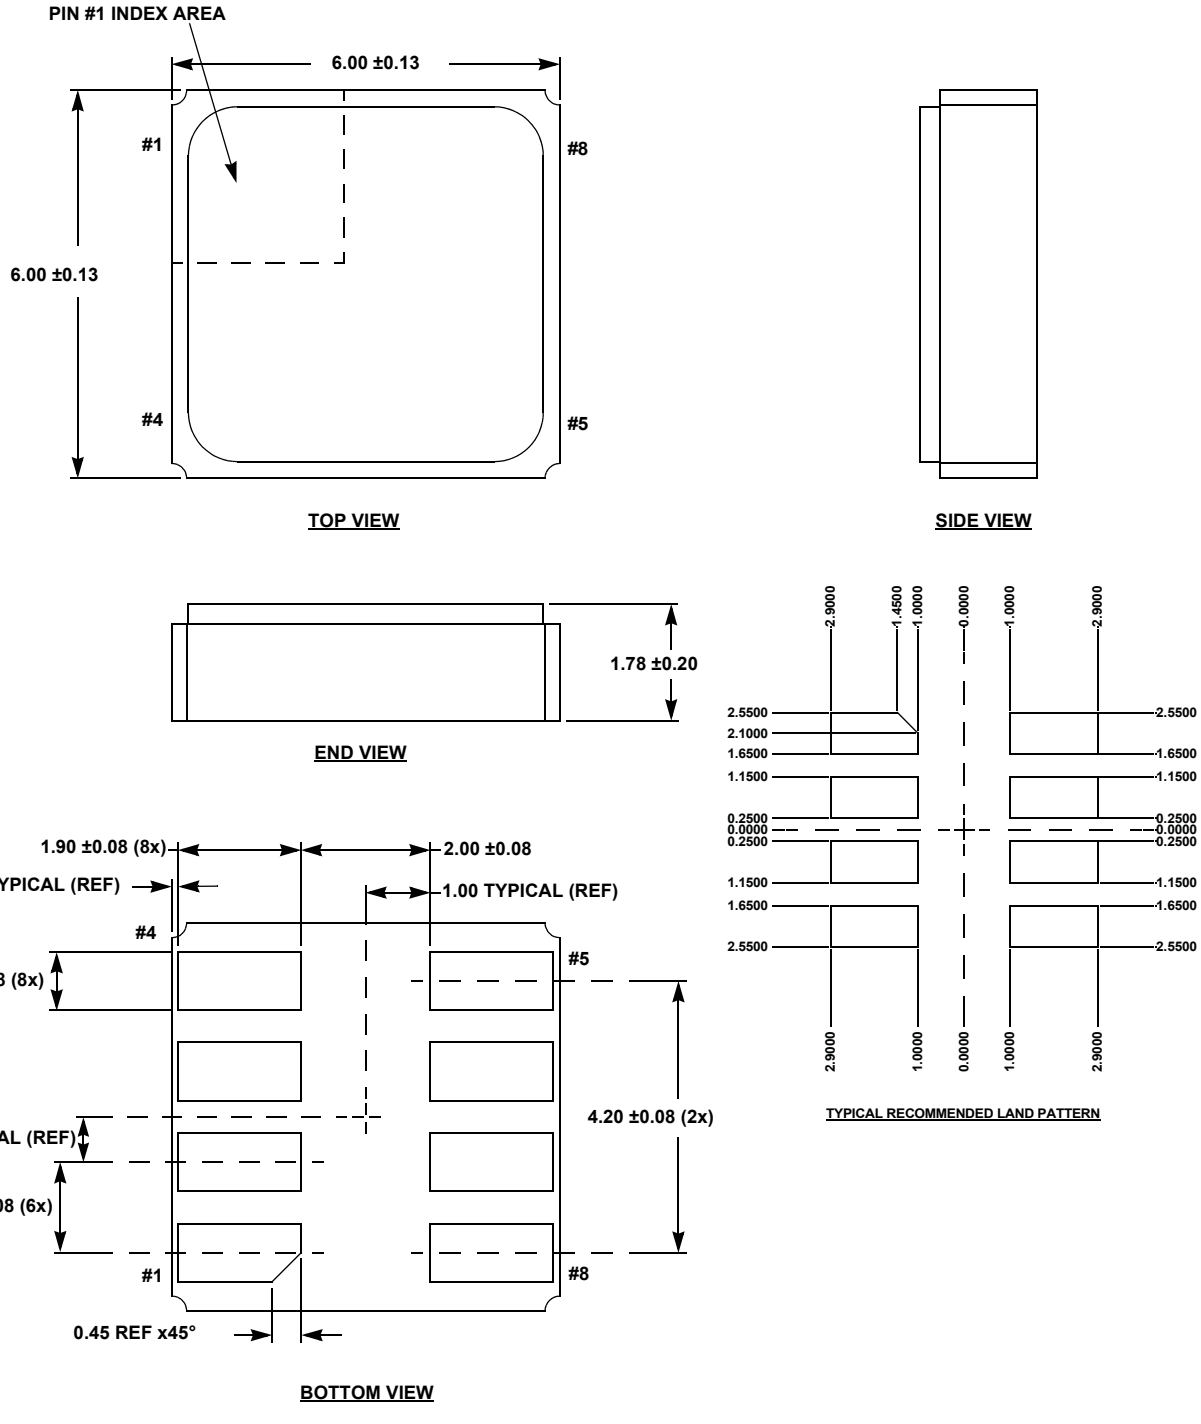
7. Revision History

Rev.	Date	Description
4.00	Apr 6, 2018	Updated the description of VDRV > UVLO conditions on page 13.
3.00	Feb 5, 2018	In Absolute Maximum Ratings on page 6, updated the maximum specification for V_{DD} and IN, INB.
2.00	Jan 19, 2018	Updated Figure 1. Removed About Intersil section. Updated Disclaimer.
1.00	Dec 7, 2017	Added Note 2 reference. Updated Pin 8 Description. Updated HBM value from 4kV to 6kV. Updated Electrical specification and Typical performance curve headings. Updated 36ms to 40ms on page 12 in last sentence.
0.00	Nov 29, 2017	Initial release

8. Package Outline Drawing

For the most recent package outline drawing, see J8.A.

J8.A
8 Pin 6mm x 6mm Hermetic Surface Mount Package
Rev 0, 3/16



NOTES:

1. The corner shape (radius, chamfer, etc.) may vary at the manufacturers option from that shown on the drawing.
2. The package thickness dimension is the package height before being solder dipped.
3. Dimensions are in millimeters.

Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.
3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
4. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.
5. Renesas Electronics products are classified according to the following two quality grades: “Standard” and “High Quality”. The intended applications for each Renesas Electronics product depends on the product’s quality grade, as indicated below.

   "Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.

   "High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.

   Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user’s manual or other Renesas Electronics document.
6. When using Renesas Electronics products, refer to the latest product information (data sheets, user’s manuals, application notes, “General Notes for Handling and Using Semiconductor Devices” in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.
7. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.
8. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
9. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.
10. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.
11. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.

(Note 1) “Renesas Electronics” as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.

(Note 2) “Renesas Electronics product(s)” means any product developed or manufactured by or for Renesas Electronics.
